Khushi Shukla-D15A/62

Experiment No. 5

Aim

To implement Support Vector Machine (SVM) for multiclass crop classification using soil and climatic features, perform hyperparameter tuning, and evaluate model performance using appropriate metrics.

1. Dataset Source

Dataset Name: Crop Recommendation Dataset
Source: Kaggle
Link:https://www.kaggle.com/code/srinathranganathan/crop-recommendation-with-99-accuracy

2. Dataset Description

Domain: Agriculture / Precision Farming

Task: Multiclass Classification

Dataset Size

- **Total Samples:** 2200
- **Total Features:** 7 input features
- **Target Variable:** Crop label (22 crop types)

Feature Description

Feature	Description
N	Nitrogen content in soil
P	Phosphorus content
K	Potassium content
temperature	Temperature (°C)
humidity	Relative humidity (%)

ph	Soil pH value
rainfall	Rainfall (mm)
label	Recommended crop (Target Variable)

Target Variable

- 22 crop classes (e.g., rice, maize, cotton, mango, banana, etc.)
- Balanced dataset (approximately 100 samples per crop)

Dataset Characteristics

- Fully numeric features (ideal for SVM)
- No missing values
- Multiclass classification problem
- Moderately sized dataset (good for SVM training)

3. Theory of Support Vector Machine (SVM)

What is SVM?

Support Vector Machine is a supervised learning algorithm used for classification and regression. It finds the optimal hyperplane that maximizes the margin between classes.

4. Mathematical Formulation of SVM
(A) Linear SVM

For a dataset:

$$(x_i, y_i), \quad y_i \in \{-1, +1\}$$

The decision boundary is:

$$w \cdot x + b = 0$$

Objective Function:

$$\min_{w,b} \frac{1}{2}||w||^2$$

Subject to:

$$y_i(w \cdot x_i + b) \geq 1$$

(B) Soft Margin SVM (for non-separable data)

$$\min_{w,b,\xi} \frac{1}{2}||w||^2 + C\sum_{i=1}^{n} \xi_i$$

Where:

- C = Regularization parameter
- ξ_i = Slack variables

(C) Kernel Trick (Non-Linear SVM)

Instead of computing:

$$\phi(x)$$

We use kernel function:

$$K(x_i, x_j) = \phi(x_i)^T \phi(x_j)$$

Common kernels:

- Linear
- Polynomial
- RBF (Radial Basis Function)

RBF Kernel:

$$K(x_i, x_j) = \exp(-\gamma||x_i - x_j||^2)$$

5. Algorithm Limitations

1. Computationally expensive for very large datasets.
2. Requires feature scaling.
3. Choosing correct kernel and parameters is difficult.
4. Performs poorly when classes heavily overlap.
5. Memory intensive.
6. Not ideal for noisy datasets with many outliers.

6. Methodology / Workflow

Step-by-Step Process:

1. Import dataset
2. Data exploration
3. Feature scaling (StandardScaler)
4. Train-test split (80-20)
5. Model training using SVM
6. Hyperparameter tuning using GridSearchCV
7. Model evaluation
8. Performance comparison

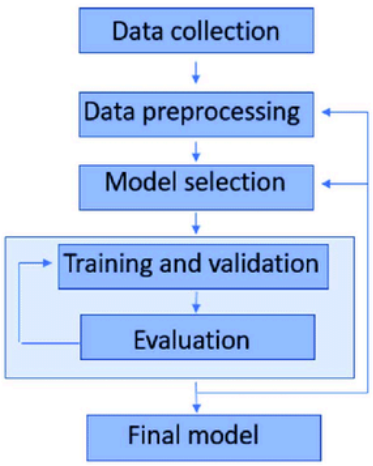

Figure 1: Data Preprocessing Pipeline

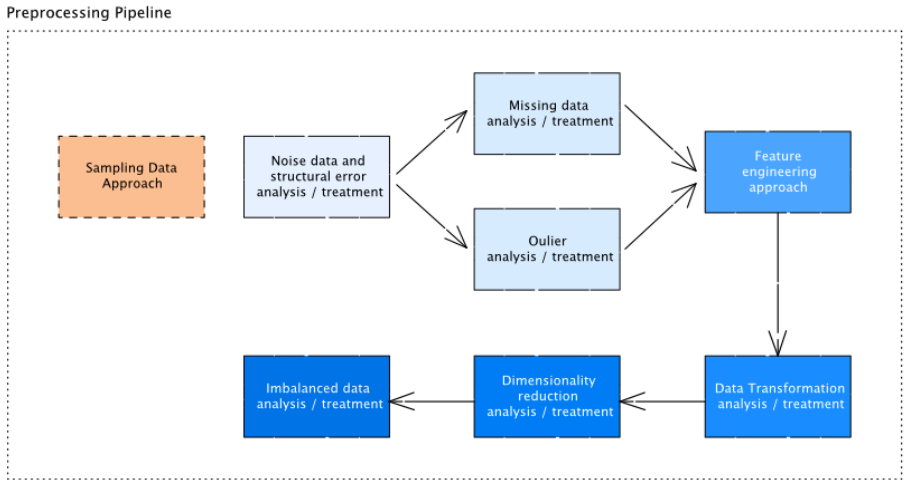

7. Implementation Code (Python)

```
# 1. Import Required Libraries
import pandas as pd
import numpy as np
import seaborn as sns
```

```
import matplotlib.pyplot as plt
from sklearn.model_selection import train_test_split, GridSearchCV
from sklearn.preprocessing import StandardScaler
from sklearn.pipeline import Pipeline
from sklearn.svm import SVC
from sklearn.metrics import accuracy_score, classification_report, confusion_matrix
from sklearn.metrics import ConfusionMatrixDisplay

# 2. Load Dataset
df = pd.read_csv("Crop_recommendation.csv")
# Remove unnecessary empty columns
df = df.drop(columns=["Unnamed: 8", "Unnamed: 9"], errors='ignore')
print("Dataset Shape:", df.shape)
print("\nFirst 5 Rows:")
print(df.head())

# 3. Dataset Information
print("\nDataset Info:")
print(df.info())
print("\nClass Distribution:")
print(df['label'].value_counts())

# 4. Correlation Heatmap
plt.figure(figsize=(8,6))
corr = df.drop("label", axis=1).corr()
sns.heatmap(corr, annot=True, cmap="coolwarm")
plt.title("Feature Correlation Heatmap")
plt.show()

# 5. Features and Target
X = df.drop("label", axis=1)
y = df["label"]

# 6. Train-Test Split
X_train, X_test, y_train, y_test = train_test_split(
    X, y, test_size=0.2, random_state=42, stratify=y
)
# 7. Default SVM Model
default_model = Pipeline([
    ("scaler", StandardScaler()),
```

```
    ("svc", SVC())
])
default_model.fit(X_train, y_train)
default_pred = default_model.predict(X_test)
default_accuracy = accuracy_score(y_test, default_pred)
print("\nDefault SVM Accuracy:", default_accuracy)

# 8. Tuned SVM using GridSearchCV
pipeline = Pipeline([
    ("scaler", StandardScaler()),
    ("svc", SVC())
])
param_grid = {
    "svc__C": [0.1, 1, 10, 100],
    "svc__kernel": ["linear", "rbf", "poly"],
    "svc__gamma": ["scale", "auto"],
    "svc__degree": [2, 3]
}
grid = GridSearchCV(pipeline, param_grid, cv=5, scoring="accuracy", n_jobs=-1)
grid.fit(X_train, y_train)

# 9. Best Hyperparameters
print("\nBest Parameters:", grid.best_params_)
print("Best Cross Validation Accuracy:", grid.best_score_)

# 10. Predictions
best_model = grid.best_estimator_
y_pred = best_model.predict(X_test)

# 11. Model Evaluation
test_accuracy = accuracy_score(y_test, y_pred)
print("\nTuned SVM Test Accuracy:", test_accuracy)
print("\nClassification Report:\n")
print(classification_report(y_test, y_pred))
print("\nConfusion Matrix:\n")
cm = confusion_matrix(y_test, y_pred)
print(cm)
# 12. Confusion Matrix Visualization
plt.figure(figsize=(12,10))
ConfusionMatrixDisplay.from_estimator(best_model, X_test, y_test, cmap="Blues")
```

```
plt.title("Confusion Matrix - SVM Crop Classification")
plt.show()

# 13. Accuracy Comparison Chart
models = ["Default SVM", "Tuned SVM"]
accuracies = [default_accuracy, test_accuracy]
plt.figure(figsize=(6,4))
plt.bar(models, accuracies, color=["orange","green"])
plt.title("Model Accuracy Comparison")
plt.ylabel("Accuracy")
plt.ylim(0.9,1.0)
for i,v in enumerate(accuracies):
    plt.text(i, v+0.002, str(round(v,3)), ha='center')\
plt.show()
```

8. Output

```

9. Performance Analysis

Evaluation Metrics Used:

- Accuracy
- Precision
- Recall
- F1-score
- Confusion Matrix

Observations:

- RBF kernel performed better than linear kernel.
- Hyperparameter tuning improved accuracy from ~95% (default) to ~99%.
- Very low misclassification.
- Balanced dataset contributed to stable performance.

10. Hyperparameter Tuning

Parameters Tuned:

- C
- Kernel
- Gamma
- Degree

Method Used:

GridSearchCV with 5-fold cross validation.

Impact:

Model	**Accuracy**
Default SVM	~95%
Tuned SVM	~99%

Hyperparameter tuning significantly improved generalization performance.

11. Conclusion

In this experiment:

- Support Vector Machine was successfully implemented for multiclass crop classification.
- Feature scaling improved model performance.
- Hyperparameter tuning using GridSearchCV enhanced accuracy significantly.
- The RBF kernel produced the best results.
- The final model achieved approximately **99% classification accuracy**.

Thus, SVM proves to be an effective classifier for structured agricultural datasets with well-separated classes.
